

CLOUDKART

Password Reset & Login Recovery Guide

Technical Support Knowledge Base

Covers self-service password reset, troubleshooting missing reset emails, password requirements, social login accounts, two-factor authentication recovery, and full account access recovery.

Appendix A: Lockout Thresholds	12

1. Overview

This guide covers password reset, login troubleshooting, and account access recovery for CloudKart accounts. It applies to web, desktop, and mobile login flows, which all share the same underlying authentication system.

Login and password issues are among the highest-volume support categories. Most cases are fully self-service and should be resolved without creating a ticket. Only cases involving lost access to the account email address, or two-factor authentication recovery, require human agent involvement.

Worked Examples

Scenario: Customer says they can't log in and doesn't say why.

Resolution: Ask two questions: (1) Do they see an error message, and if so, what does it say? (2) Are they using an email/password or a social login (Google/Microsoft)?

Scenario: Agent receives a high volume of login-failure reports simultaneously.

Resolution: Check the Status Page first — simultaneous failures often indicate an auth service incident rather than individual customer issues.

2. Standard Password Reset

Customers who remember their email but not their password can reset it without contacting support.

- 1 On the login screen, click **Forgot Password**.
- 2 Enter the email address associated with the account and submit.
- 3 Check inbox (and spam folder) for an email titled 'Reset your CloudKart password,' which arrives within 2 minutes under normal conditions.
- 4 Click the reset link — valid for 30 minutes — and enter a new password meeting the complexity requirements in Section 4.
- 5 Sign in with the new password; all other active sessions are automatically signed out as a security measure.

Tip for the Support Chatbot

'How do I reset my password' is one of the highest-frequency support questions. The chatbot should answer directly from this section without creating a ticket, since this is fully self-service.

Worked Examples

Scenario: Customer clicked the reset link but says it doesn't work.

Resolution: Reset links expire after 30 minutes; if more than 30 minutes have passed they need to request a new one. Also check they're clicking and not copy-pasting (some email clients wrap URLs in a way that breaks them).

Scenario: Customer completed the reset but is still being asked for the old password.

Resolution: A password manager may be auto-filling the old credential; advise clearing the saved password for cloudkart.com and typing the new one manually.

3. Troubleshooting a Missing Reset Email

If the reset email never arrives, the cause is usually one of the following.

- The email was filtered to spam or a promotions tab — ask the customer to check both before assuming non-delivery.
- The email address entered doesn't match any account — common when a customer has multiple email addresses and is unsure which one was used to sign up.
- A corporate email filter is blocking external mail — suggest checking with IT or trying a personal email if one is on file.
- The customer signed up using a social login (Google or Microsoft) and has no CloudKart password to reset — see Section 5 for this scenario.

If none of the above explains the missing email after 10 minutes, an agent can manually trigger a reset email from the Admin Console using the account's verified account ID. This is a last resort — agents should exhaust the customer-facing steps first since manual triggers consume a support action that is logged and audited.

Worked Examples

Scenario: Customer says they've checked spam and the email definitely hasn't arrived.

Resolution: Ask which email they entered; confirm it matches their account email in the Admin Console before manually triggering a reset from the console.

Scenario: Customer works at a large company and suspects the IT filter is blocking the email.

Resolution: Ask them to try using a personal email address if their account has one as a secondary email; alternatively IT can whitelist @cloudkart.com for future emails.

4. Password Requirements

New passwords must meet CloudKart's complexity requirements, enforced both client-side and server-side.

Requirement	Detail
Minimum length	10 characters
Character variety	At least one uppercase letter, one number, and one symbol
Reuse restriction	Cannot match any of the last 5 passwords on the account
Common password check	Rejected if found in known breached-password databases

Customers sometimes encounter the breached-password rejection and don't understand why a password they 'just made up' was rejected. Agents should explain that CloudKart checks new passwords against publicly known data breach lists (not CloudKart's own data), and that choosing a longer, more unique passphrase resolves this in almost all cases.

Worked Examples

Scenario: Customer's new password is rejected but they think it meets the requirements.

Resolution: Check whether the password appears in the breached-password database (the error message indicates this); if so, suggest a longer, less common passphrase.

Scenario: Customer can't remember any of their last 5 passwords to avoid reuse.

Resolution: They simply need to choose something new — the system checks automatically; there is no way to view past passwords to compare.

5. Accounts Using Social Login

Accounts created through Google or Microsoft social login do not have a CloudKart password at all — authentication is handled entirely by the social provider. This is a common source of confusion.

If a customer with a social login account requests a password reset, the standard reset flow will return a message indicating the account uses social login and directing them to sign in through Google or Microsoft directly. Agents should never attempt to manually set a password for a social-login account, since this could bypass the provider's own security controls.

Important

Customers can add a CloudKart password to a social-login account from Account Settings > Security > Add Password, allowing both sign-in methods going forward. This must be done while logged in; it cannot be done from the login screen.

Worked Examples

Scenario: Customer signed up with Google, now wants to log in with email/password.

Resolution: They need to add a CloudKart password from Account Settings > Security > Add Password while logged in via Google. After that, both methods work.

Scenario: Customer lost access to their Google account used to sign up.

Resolution: See Section 7 — this is an account recovery case requiring identity verification, since they can't prove ownership via the social provider.

6. Two-Factor Authentication Recovery

Two-factor authentication (2FA) adds a second verification step at login. Customers who have lost access to their 2FA method need a separate recovery path.

- 1 If the customer still has backup codes (provided when 2FA was first enabled), they can enter one in place of the live 2FA code.
- 2 If backup codes are lost, the customer can request 2FA removal through Account Settings > Security > Lost 2FA Access, which requires identity verification via a government ID upload reviewed by the Security team.
- 3 Identity verification typically completes within 24 hours; expedited review is not available even for urgent business needs — this is a security safeguard.

Worked Examples

Scenario: Customer lost their phone with the authenticator app and has no backup codes.

Resolution: Route to Account Settings > Security > Lost 2FA Access; they'll need to submit a government ID for verification. Warn them it takes up to 24 hours.

Scenario: Customer asks why expedited 2FA recovery isn't available for their urgent case.

Resolution: Explain that the 24-hour minimum exists specifically to frustrate attackers who might try to social-engineer account takeover — it protects legitimate users too.

7. Recovering Access Without Email Access

When a customer cannot access the email address on file (e.g., a former work email that no longer exists), standard password reset is not possible since it depends on email access.

These cases require manual account recovery through the Identity Verification team. The customer must provide proof of account ownership — such as the last 4 digits of the payment method on file, recent invoice amounts, or account creation date — cross-checked against account records before any email change is approved.

Security Notice

Never change the email address on an account based solely on a customer's verbal claim of ownership in chat or over the phone. Email changes on recovery cases must go through the Identity Verification team's documented process.

Worked Examples

Scenario: Customer left a company and can't access their old work email linked to the account.

Resolution: Open an Identity Verification ticket — tag `idv-email-recovery`. The team will verify ownership using payment method details or invoice history.

Scenario: Agent is tempted to change the email in the Admin Console to help a customer quickly.

Resolution: Do not — all email changes without IdV completion are a security policy violation regardless of how convincing the customer's story is.

8. Other Common Login Issues

This section addresses login problems unrelated to forgotten passwords.

Q: I enter the correct password but it still says invalid.

A: Check for accidental Caps Lock, autofill entering an outdated saved password, or extra trailing spaces copied with the password. Suggest typing manually rather than pasting.

Q: My account says it's locked. Why?

A: Accounts lock automatically after 5 consecutive failed login attempts within 15 minutes, as brute-force protection. The lock clears after 30 minutes, or immediately upon a successful password reset.

Q: I can log in on web but not on the mobile app.

A: Usually an outdated app version with a stale authentication flow. Update the app; if the issue persists, escalate with tag tech-login-mobile-only.

Worked Examples

Scenario: Customer is locked out after a failed login loop and the 30-minute wait is too long.

Resolution: Offer a password reset instead — a successful reset clears the lockout immediately without waiting for the timer to expire.

Scenario: Customer logs in fine on desktop but the mobile app says 'session expired' immediately.

Resolution: This is different from the standard login issue; escalate with tag tech-login-mobile-only and include the app version and device OS.

9. Quick Reference: Login Recovery Paths

This quick reference summarises the login/access recovery path based on the customer's situation, for use during high-volume login support periods.

Customer Situation	Recovery Path	Estimated Resolution Time
Forgot password, has email access	Standard reset (Section 2)	2–5 minutes self-service
Reset email not arriving	Troubleshoot (Section 3); manual trigger if needed	5–15 minutes
Signed up with Google/Microsoft	Social login path (Section 5)	Immediate self-service
Lost 2FA device	IdV via government ID (Section 6)	Up to 24 hours
Lost access to account email	IdV team recovery (Section 7)	1–3 business days
Account locked after failed attempts	Wait 30 min or reset password (Section 8)	0–30 minutes

Worked Examples

Scenario: Customer needs urgent 2FA recovery for a time-sensitive business deadline.

Resolution: Set clear expectation: 24 hours minimum regardless of urgency — this is a security safeguard that cannot be bypassed. Offer alternative: can any account tasks be completed by the account owner via another device in the interim?

Scenario: Multiple customers locked out simultaneously.

Resolution: Check the Status Page — simultaneous lockouts may indicate an auth incident rather than individual user errors needing separate resolution.

Appendix A: Lockout Thresholds

Account lock and lockout thresholds enforced by the authentication system.

Trigger	Lockout Duration
5 failed logins within 15 minutes	30 minutes
10 failed 2FA attempts within 1 hour	1 hour
3 failed identity verification submissions	Manual review required to unlock
